# BEST-FIRST GRAPH SEARCH

- A search strategy is defined by picking the **order of node expansion**
- Best-First Search: use an **evaluation function**  $f(n)$  for each node
  - estimate of "desirability"
  - Expand most desirable unexpanded node
- Special cases:
  - greedy best-first search
  - A\* search

This slides are designed for assignment 3, not included in final exam.

# ROMANIA WITH STEP COSTS IN KM

Straight-line distance  
to Bucharest

What is the shortest path from Arad to Bucharest?

# GREEDY BEST-FIRST SEARCH

- Evaluation function  $f(n) = h(n)$  (**h**euristic)
  - = estimate of cost from  $n$  to *goal*
- e.g.,  $h_{SLD}(n)$  = straight-line distance from  $n$  to Bucharest
- Greedy best-first search expands the node that **appears** to be closest to goal

# GREEDY BEST-FIRST SEARCH EXAMPLE

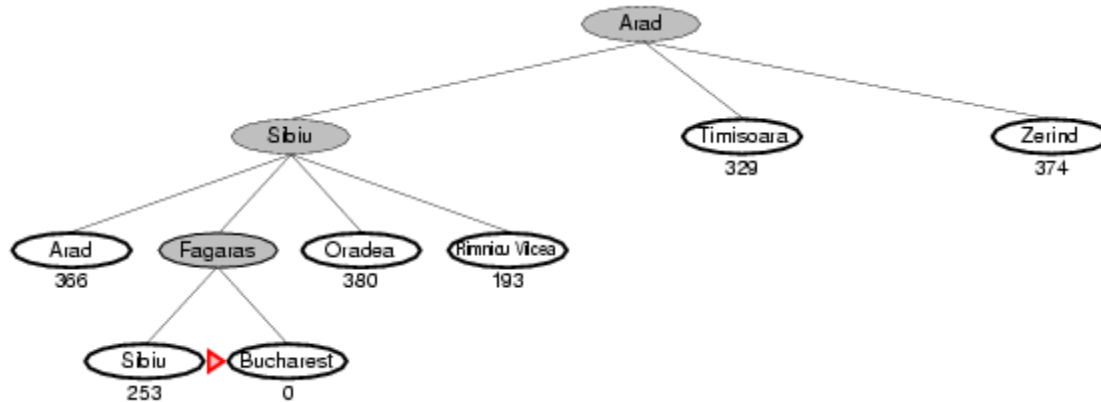

# GREEDY BEST-FIRST SEARCH EXAMPLE

# GREEDY BEST-FIRST SEARCH EXAMPLE

# GREEDY BEST-FIRST SEARCH EXAMPLE

# PROPERTIES OF GREEDY BEST-FIRST SEARCH

- **Complete?** No – can get stuck in loops, e.g., Iasi  $\rightarrow$  Neamt  $\rightarrow$  Iasi  $\rightarrow$  Neamt  $\rightarrow$
- **Time?** Exponential, but a good heuristic can give dramatic improvement
- **Space?** keeps all nodes in memory
- **Optimal?** No

# A\* SEARCH

- Idea: avoid expanding paths that are already expensive
- Evaluation function  $f(n) = g(n) + h(n)$ 
  - $g(n)$  = cost so far to reach  $n$
  - $h(n)$  = estimated cost from  $n$  to goal
  - $f(n)$  = estimated total cost of path through  $n$  to goal

# A\* SEARCH EXAMPLE

▶ Arad

# ADMISSIBLE HEURISTICS

- A heuristic  $h(n)$  is **admissible** if for every node  $n$ ,  $h(n) \leq h^*(n)$ , where  $h^*(n)$  is the **true** cost to reach the goal state from  $n$ .
- An admissible heuristic **never overestimates** the cost to reach the goal, i.e., it is **optimistic**
- **Theorem:** If  $h(n)$  is admissible,  $A^*$  using TREE-SEARCH is optimal

# OPTIMALITY OF $A^*$ (PROOF)

- Suppose some suboptimal goal  $G_2$  has been generated and is in the fringe. Let  $n$  be an unexpanded node in the fringe such that  $n$  is on a shortest path to an optimal goal  $G$ .

- $f(G_2) = g(G_2)$  since  $h(G_2) = 0$
- $g(G_2) > g(G)$  since  $G_2$  is suboptimal
- $f(G) = g(G)$  since  $h(G) = 0$
- $f(G_2) > f(G)$  from above

# OPTIMALITY OF $A^*$ (PROOF)

- Suppose some suboptimal goal  $G_2$  has been generated and is in the fringe. Let  $n$  be an unexpanded node in the fringe such that  $n$  is on a shortest path to an optimal goal  $G$ .

- $f(G_2) > f(G)$  from above
- $h(n) \leq h^*(n)$  since  $h$  is admissible
- $g(n) + h(n) \leq g(n) + h^*(n)$
- $f(n) \leq f(G)$
- Hence  $f(G_2) > f(n)$ , and  $A^*$  will never select  $G_2$  for expansion

# CONSISTENT HEURISTICS

- A heuristic is **consistent** if for every node  $n$ , every successor  $n'$  of  $n$  generated by any action  $a$ ,

$$h(n) \leq c(n, a, n') + h(n')$$

- If  $h$  is consistent, we have

$$\begin{aligned} f(n') &= g(n') + h(n') \\ &= g(n) + c(n, a, n') + h(n') \\ &\geq g(n) + h(n) \\ &= f(n) \end{aligned}$$

- i.e.,  $f(n)$  is non-decreasing along any path.
- **Theorem:** If  $h(n)$  is consistent, A\* using GRAPH-SEARCH is optimal

## OPTIMALITY OF $A^*$

- $A^*$  expands nodes in order of increasing  $f$  value
- Gradually adds " $f$ -contours" of nodes
- Contour  $i$  has all nodes with  $f=f_i$ , where  $f_i < f_{i+1}$

# PROPERTIES OF $A^*$

- **Complete?** Yes (unless there are infinitely many nodes with  $f \leq f(G)$  )
- **Time?** Exponential
- **Space?** Keeps all nodes in memory
- **Optimal?** Yes

# ADMISSIBLE HEURISTICS

E.g., for the 8-puzzle:

- $h_1(n)$  = number of misplaced tiles
- $h_2(n)$  = total Manhattan distance  
(i.e., no. of squares from desired location of each tile)

|   |   |   |
|---|---|---|
| 7 | 2 | 4 |
| 5 |   | 6 |
| 8 | 3 | 1 |

**Start State**

|   |   |   |
|---|---|---|
|   | 1 | 2 |
| 3 | 4 | 5 |
| 6 | 7 | 8 |

**Goal State**

- $h_1(S) = ?$
- $h_2(S) = ?$

# ADMISSIBLE HEURISTICS

E.g., for the 8-puzzle:

- $h_1(n)$  = number of misplaced tiles
- $h_2(n)$  = total Manhattan distance  
(i.e., no. of squares from desired location  
of each tile)

|   |   |   |
|---|---|---|
| 7 | 2 | 4 |
| 5 |   | 6 |
| 8 | 3 | 1 |

Start State

|   |   |   |
|---|---|---|
|   | 1 | 2 |
| 3 | 4 | 5 |
| 6 | 7 | 8 |

Goal State

- $h_1(S) = ?$  8
- $h_2(S) = ?$  3+1+2+2+2+3+3+2 = 18

# DOMINANCE

- If  $h_2(n) \geq h_1(n)$  for all  $n$  (both admissible)
- then  $h_2$  **dominates**  $h_1$ , and  $h_2$  is better for search
- Typical search costs (average number of nodes expanded):
- $d=12$ 
  - IDS = 3,644,035 nodes
  - $A^*(h_1) = 227$  nodes
  - $A^*(h_2) = 73$  nodes
- $d=24$ 
  - IDS = too many nodes
  - $A^*(h_1) = 39,135$  nodes
  - $A^*(h_2) = 1,641$  nodes

THANKS
